CORRECTION NOTE

The minus sign failed to print preceding minimum temperatures for the 8th day in Table 5 of this bulletin for January 1954. Add the minus sign on January 8th for these stations: Sierraville RS and Soda Springs.

These corrections will be republished in the June 1954 issue.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

\- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

MARCH 1954
Volume LVIII No. 3

CHATTANOOGA: 1954

CALIFORNIA - MARCH 1954

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 48.8° or 2.6° below the weighted mean. The unweighted average temperature based on the same 317 stations was 48.4° or 2.6° below the unweighted mean. The highest temperature, 94°, was reported from Indio U.S. Date Garden in the Coachella Valley in Riverside County at an elevation of 11 feet above mean sea level, on the 5th and 8th. The lowest temperature, -11°, was recorded at Boca in Nevada County at an elevation of 5535 feet on the 12th.

The average precipitation for the State based on 319 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 4.21 inches or 0.88 inch above the weighted mean. The unweighted average based on the same 319 stations was 4.72 inches or 0.97 inch above the weighted mean. Based on 549 stations listed in Table 3 the unweighted average precipitation was 5.01 inches or 1.26 inches above the unweighted mean. The greatest monthly total precipitation, 16.61 inches, was reported from Cuyamaca at an elevation of 4677 feet in San Diego County. The least monthly total precipitation, 0.13 inch, was reported from Calexico at an elevation of three feet above mean sea level in Imperial County, also, in the extreme southern portion of the State. The greatest daily total precipitation, 5.78 inches, occurred at Turntable Creek at an elevation of 1080 feet in Shasta County on the 10th.

The greatest monthly total snowfall, 104.5 inches, occurred at Twin Lakes at an elevation of 7920 feet in Alpine County. Raywood Flats at an elevation of 7200 feet in San Bernardino County, reported a total snowfall of 100.2 inches and Grant Grove at an elevation of 6580 feet in Tulare County, 100.5 inches. Fourteen other stations in the Sierra Nevada and southern mountain area reported total monthly snowfalls of 50 inches or more. Generally the total snowfall for the month was much-above normal but less than amounts recorded in March of 1952.

Rains in the north coastal area slowed farming operations but benefited crops, particularly grasses and other pasture and range feed.

Warm weather in the central coastal area during the first week was favorable for grains and grasses. In Santa Clara County apricot blossoms opened rapidly, and late almond varieties were in full bloom. Prune leaf buds started to color, and some early blooming was observed in strawberries. Precipitation during the month was very beneficial for growth of grains, grasses, and other crops. Frosts during the second decade resulted in considerable orchard heating in Santa Clara and San Benito Counties for apricots and other fruits which were in blossom. Below-freezing temperatures in the Salinas district resulted in some injury to artichokes, spinach, and sugar beets and some severe injury to some fields of direct-seeded tomatoes. Below-normal temperatures during the latter two decades slowed development of fruits and some truck crops.

Much-above normal temperatures in the upper Sacramento Valley during the first week brought almonds into full bloom and, following the recent rains, were very beneficial for development of pasture and range grasses. Drying, northerly winds during the first four days contributed to crusting of topsoils in many fields which was unfavorable for growth of grains planted before the previous rains but which had not emerged. Rains during the second and third weeks interrupted field activities but benefited growing crops. Temperatures during the last three weeks were generally below normal. Some orchard heating was required in almond orchards when temperatures dropped to the freezing point and below. Minimum temperatures in some orchards east of the Sacramento River were reported as low as 29° on the 12th and 13th. Spraying of grain fields for weeds was impossible due to recurring rains, and soils were too wet for plowing operations. A few thunderstorms with hail were reported on the 24th.

Warm, sunny weather in the lower Sacramento Valley during the first week was favorable for farming activities. Grains made rapid progress, and fruit and nut trees were blooming about two weeks earlier than usual. This was a rare season with weather permitting planting of considerable acreages of sugar beets without interruption. Rains during the second week were beneficial for maintaining optimum conditions for growing crops. Temperatures during the second decade were well-below normal with numerous reports of frost. The minimum temperature of 33° at Sacramento on the 13th was reported as the lowest temperature of record for that date at that station. The previous record-low temperature for Sacramento for the 13th was 34° in 1880. In the Delta district asparagus above ground was damaged by frost to the extent of 50 to 90 percent. Temperatures on mornings of the 13th and 14th ranged from 26° to 28° in some districts. Heavy damage was reported in almonds in the Chico district. On the evening of the 19th a heavy hailstorm was reported during a 20-minute period at Courtland with an accumulation of two to three inches of hailstones on the ground, many about the size of marbles. This was the heaviest hailstorm in the memory of residents in this district. Some hail damage was reported to buds on trees; however, it would have been much greater if buds had been further developed. Convective showers on the 24th brought scattered reports of hail from the north Sacramento and Carmichael districts. At Carmichael, about 12 miles NE of Sacramento, 0.45 inch of precipitation was reported during a 20-minute period with heavy thunder and from one-half to one inch of hail.

Much-above normal temperatures in the lower San Joaquin Valley during the first week accelerated blossoming and swelling of buds on fruit and nut trees. Almonds blossomed in Fresno County with buds swelling on early peaches and plums. Local frosts were reported on some mornings during the second decade with temperatures as low as 28° to 29°. Considerable damage occurred to almonds in Merced County. Hail was reported in some districts on the 18th and thunderstorms and heavy rain showers accompanied by hail were reported on the 24th. Layton, a small community about 10 miles south of Fresno, reported 1.27 inches of rain from one heavy shower. Rains during the month were beneficial to almost every farming activity. At Fresno heavy fog was reported on six days. This was the greatest number of days with heavy fog at Fresno for the month of March since records began.

In the upper San Joaquin Valley almond trees were in full bloom, and early plums were starting to blossom under well-above normal temperature conditions during the first week. Ranges in foothills and mountains looked good but were in need of more precipitation. Frosts during the second week resulted in some damage to potatoes in low spots, slight damage to grapes, and some damage to Early Beauty plums which were in blossom. Frost resulted in some damage in mountain orchards, particularly in peaches in the Frazier district and pears in the Tehachapi district. Strong winds from about 10:00 a.m. to 2:00 p.m. on the 16th resulted in considerable damage to television antennas, car ports, roofs, and porches within a 15-mile radius of Bakersfield. Damage to property was estimated at $600,000. Some newly-planted alfalfa in the Edison district was blown from the ground, and some potato plants were whipped by the wind, but in general the crop was not damaged seriously. Rains during the latter portion of the month were very beneficial for pastures and other growing crops.

Well-above normal temperatures in the Santa Maria area during the first decade were favorable for most crops but resulted in a growth of cauliflower which was faster than desirable. Some frost damage was reported during the month to low-land strawberries and some outer leaves on lettuce. In the San Luis Obispo district almonds sustained some damage due to frosts.

Warm weather in the Los Angeles area during the first decade accelerated growth of all vegetation. Deciduous trees bloomed profusely with new growth and buds showing on citrus. Topsoil moisture decreased rapidly under conditions of high temperature and low relative humidity. Somewhat cooler weather during the latter two decades was favorable for slowing the depletion of surface soil moisture and slowing development of citrus and deciduous fruit blossoming. Pest control work was resumed in some districts with the advent of cooler weather. Below-freezing temperatures on the 12th and 13th required some orchard heating with scattered frost damage to citrus and deciduous fruits in unheated orchards, mostly on low ground. Rains during the last half of the month were very beneficial in replenishing surface and subsoil moisture as the rate of fall generally permitted maximum soil penetration. Rains were favorable for grains, grasses, and other crops, but unfavorable for pollination of orange blossoms in some districts. Strong winds from about 8:00 a.m. to 5:00 p.m. on the 16th resulted in damage to asbestos shingle roofs, television antennas, etc., in the Victorville Housing Project at George Air Base five miles north of Victorville with losses estimated at $3,800. At Adelanto about five miles northwest of Victorville, several buildings were also reported damaged by strong winds on the 16th.

Above-normal temperatures in the San Diego area during the first decade contributed to early blooming of fruit trees. Rains during the last decade were extremely beneficial to crops, particularly grains which were approaching a critical condition.

In the Imperial Valley strong winds during the first half of the month resulted in some damage to hay and grain. Warm weather was favorable for melons, vegetables, and other crops.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

\- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

W Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1954

CALIFORNIA - APRIL 1954

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 314 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 60.1° or 3.1° above the weighted mean. The unweighted average temperature based on the same 314 stations was 58.6° or 2.7° above the unweighted mean. The highest temperature, 108°, was recorded at Greenland Ranch in Inyo County and Indio U.S. Date Garden in Riverside County on the 18th. The lowest temperature, -1°, was recorded at Soda Springs at an elevation of 6752 feet in Nevada County on the 1st.

The average precipitation for the State based on 318 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 1.61 inches or 0.09 inch below the weighted mean. The unweighted average based on the same 318 stations was 1.72 inches or 0.16 inch below the unweighted mean. Based on 547 stations listed in Table 3 the unweighted average precipitation was 1.78 inches or 0.10 inch below the unweighted mean. The greatest monthly precipitation, 12.05 inches, was reported from Cazadero in Sonoma County. Lakeshore in Shasta County reported the greatest daily total precipitation, 5.02 inches, on the 4th. Thirteen stations mostly in southern California reported only a trace of precipitation, and 34 stations reported no precipitation.

Snowfall during April was generally light. The greatest monthly total snowfall, 20.0 inches, occurred at Soda Springs at an elevation of 6752 feet in Nevada County, and was 11.0 inches below normal for this station. Twin Lakes at an elevation of 7920 feet in Alpine County received 18.5 inches. Huntington Lake at an elevation of 7020 feet in Fresno County reported 10.0 inches. Twenty-three other stations received measurable amounts of snowfall of six inches or less.

Rains in the north coastal area during the first week were beneficial to crops; however, field activities were generally slowed. Dry weather during the second and third weeks permitted considerable work in fields. Plowing and leveling operations progressed rapidly, and potato planting was generally completed. High temperatures and low relative humidities contributed to considerable drying in forests. Rains on the 26th and 27th were generally favorable for all crops and helped to sustain green grasses on pastures and ranges.

In the central coastal area rains during the first week added moisture to soils and underground water supplies and greatly benefited grains and grasses. In the Santa Clara Valley some jacket rot was reported in apricots due largely to the rains. Generally dry weather from the 7th to the 27th throughout most of the area was favorable for crops. Some light precipitation, however, in northern districts contributed to the development of some fungus diseases in fruit crops. Much-above normal temperatures during the third week had a desiccating effect upon grasses, particularly in some southern districts. Apricots sized rapidly, and prunes set satisfactorily during the warm weather. Rains on the 27th favored growing grains and truck crops but delayed cultivation of fields and strawberry picking. At San Francisco the maximum temperature of 80° on the 15th was the highest temperature ever recorded at that station for that date since temperature records began in 1875.

Precipitation in the upper Sacramento Valley during the first week slowed field activities but benefited growing crops, particularly grasses. Rainfall during the first week resulted in an abundance of grasses, and feed on pastures was above normal with the result that cattle were fattened earlier, wool was heavier and longer than normal, and the lamb crop was heavier than normal. Alfalfa growth was rapid and abundant with the first cutting starting about the middle of the month. Grains grew rapidly and brought one of the best crops in years. Dry weather during the second and third weeks permitted unlimited field activity except in a few spots which were too wet to plow. Well-above normal temperatures obviated orchard heating in peaches and almonds. Winds on some days were unfavorable for spraying of walnuts for blight. Drying winds together with the absence of precipitation resulted in maturing and drying of pastures. Early barley sustained considerable damage from smut which was favored by high relative humidities and rainfall during the first week. Irrigated pastures were brought under irrigation. Rains during the last week damaged some alfalfa which had been cut for hay and flattened some barley which had not reached maturity.

Weather in the lower Sacramento Valley during the first decade was generally favorable for all growing crops, particularly grasses and truck crops. Warmer weather would have been more beneficial for small grains which were heading. Cool, damp conditions favored the development of some mildew in spinach and some rot in apricots. In El Dorado County some frost damage was reported to apples and pears at higher elevations as well as some slight damage from hail. Rains on the 4th and 5th delayed spring harvesting of sugar beets and were unfavorable for the application of sprays for insects and fungi and the preparation of rice lands. Much-above normal temperatures from the 13th to 22d were favorable for blossoming of fruit and nut trees. Warm, dry weather was particularly favorable for preparation of rice lands. The only unfavorable aspect accompanying the warm, dry conditions was the crusting of soils, particularly in truck crops. Rains on the 27th were beneficial for most crops but resulted in some lodging in heavy stands of small grains. Orange blossoms were adversely affected as was the curing of the first cutting of alfalfa. The added moisture contributed to some increase in fungus diseases. At Sacramento 11 consecutive days with maximum temperatures of 80° or higher, from the 12th through 22d, resulted in the longest period of consecutive days with temperatures of 80° or higher since April 1897 when 9 consecutive days were recorded. Maximum temperatures on the 17th and 22d were the highest ever recorded for those dates at Sacramento.

Rains in the lower San Joaquin Valley on the 4th and 5th were beneficial for all farming interests; however, some field operations were retarded. Cotton and corn planting was delayed slightly. Much-above normal temperatures from the 16th to the 22d contributed to some drying of pastures and ranges. Generally, however, weather was favorable for all farm work. Much pumping was in progress as soils dried rapidly. In some districts the first run of ditch water was received from the mountains. Cotton made satisfactory growth with early-planted fields reported at least three inches tall by the end of the month. Blowing sand and dust accompanying strong winds on the 29th and 30th was unfavorable for cotton and some other crops.

Dry weather in the upper San Joaquin Valley was favorable for curing of the first crop of hay. Near-normal to slightly-below normal temperatures during the first decade kept soil temperatures too low for optimum growing conditions for cotton. Much-above normal temperatures from the 15th to 22d were very beneficial for cotton but unfavorable for peas. Dry, warm weather resulted in general maturing and drying of range grasses. High temperatures were favorable for development of fruit crops.

Coastal fog in the Santa Maria area during the first two decades was unfavorable for some crops. Frosts during the first part of the month damaged the sweet pea flower crop in the Lompoc area. Foggy weather was detrimental to lettuce and grains, particularly in the Guadalupe district where fogs frequently persisted most of the day. Lettuce in the Santa Maria and Santa Barbara districts sustained some losses from mildew and slime.

Generally cool, cloudy weather in the Los Angeles area was favorable for hay, grains, and pastures; however, other crops in coastal districts were in need of higher temperatures and more sunshine for optimum growing conditions. In inland districts good growing weather generally prevailed for all crops.

Weather in the San Diego area continued favorable for growth of all vegetation and for all harvesting activities. Light rains during the latter portion of the month were favorable for conserving soil moisture.

In the Imperial Valley weather continued generally favorable for all crops and harvesting operations. Melons made excellent progress under above-normal temperature conditions, and early tomatoes matured rapidly. Blowing sand accompanying strong winds on the 30th resulted in some slight damage to growing crops.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations;consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WEATHER SUMMARY

The average temperature for the State based on 311 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 65.5° or 2.4° above the weighted mean. The unweighted average temperature based on the same 311 stations was 63.3° or 1.8° above the unweighted mean. The highest temperature for the month, 115°, was recorded at Cow Creek in Death Valley, Inyo County, on the 18th. The lowest temperature, 12°, was recorded on the 1st at Twin Lakes at an elevation of 7920 feet in Alpine County.

The average precipitation for the State based on 319 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.12 inch or 0.72 inch below the weighted mean. The unweighted average based on the same 319 stations was 0.13 inch or 0.77 inch below the unweighted mean. Based on 539 stations listed in Table 3, the unweighted average was 0.13 inch or 0.77 inch below the unweighted mean. This was the third driest May for the period of record beginning with 1897 and the driest May since 1929 when the unweighted average was 0.09 inch. The driest May of record occurred in 1924 with an unweighted average of 0.08 inch. The greatest monthly precipitation, 0.95 inch, occurred at West Point 3 SW at an elevation of 2400 feet in Calaveras County. This was the lowest value of the greatest monthly amount recorded for May since 1924 when Crescent City reported 1.59 inches and the second lowest value of greatest monthly amount for the State for May since comparative records were compiled beginning with 1897. The greatest daily amount, 0.95 inch, occurred at West Point 3 SW on the 9th. In only two years the greatest daily amounts for May were less than 0.95 inch, that is, 0.70 inch at Crescent City on May 3, 1924, and 0.84 inch at Giant Forest on May 16, 1935. One hundred-two stations scattered throughout the State reported a total of zero precipitation, while 65 stations reported only a trace.

Measurable snowfall was reported from only two stations on the 1st, Twin Lakes at an elevation of 7920 feet in Alpine County, 1.0 inch; and Giant Forest at an elevation of 6360 feet in Tulare County, 1.0 inch.

Weather conditions in the north coastal area were favorable for planting of potatoes. The general lack of precipitation was favorable for haying operations but unfavorable for growing crops.

Due to the general lack of precipitation, ranges in valley districts of the upper Sacramento Valley dried early, and higher level range lands were reported as quite dry at the close of the month. Dry weather permitted unlimited activity in fields and orchards, and benefited harvesting of oats, vetch, and alfalfa. Dry conditions also decreased the threat of walnut blight and fungi growth in grains but made considerable irrigation necessary in irrigated pastures. Strong, northerly winds during the last decade were responsible for slowing of peach thinning and shattering of oats. At Red Bluff, May was one of the driest of record with only 0.01 inch of precipitation. Much-above normal temperatures occurred from the 16th through 19th. At Mount Shasta a minimum temperature of 21° was recorded on the 1st, and nearly all fruit in the vicinity of Mount Shasta was destroyed by the frost. Shrubs and flowers were also heavily damaged. This was the lowest temperature recorded at Mount Shasta for May since 1927 and the third lowest on record for May at this station. The maximum temperature of 91° on the 18th was the highest ever recorded at this station so early in the season. Also, this was the driest May at Mount Shasta since 1897. Dry conditions during the month contributed to a total of 11 forest fires which burned about 465 acres.

Warm, sunny weather in the lower Sacramento Valley hastened ripening of early strawberries and cherries. Rains on the 9th contributed to an increase in fungus growth in orchards and some lodging of small grains. Warm, dry weather during the last two decades was generally favorable for farming operations and the development of most crops. It was particularly beneficial for slowing the development of blight and mildew but was unfavorable for pastures and ranges which dried rapidly.

Dry weather with moderate temperatures in the lower San Joaquin Valley was favorable for all crops. The cotton crop was reported in excellent condition and off to a good start.

Warm weather in the upper San Joaquin Valley was very beneficial for all growing crops, particularly cotton. Warm weather together with the lack of precipitation, however, resulted in rapid drying of range grasses and unirrigated low-land pastures.

Weather in the Santa Maria area was very favorable for all crops except lettuce which was generally of poor quality due to foggy weather. Pastures and ranges dried rapidly. Some young pepper plants were adversely affected by strong, drying winds.

In the Los Angeles area cool, cloudy weather along the coast was unfavorable for most crops which were in need of heat and sunshine for optimum growth. Higher temperatures and sunshine in inland districts were favorable for citrus and other fruits. Generally, weather was too cool for optimum growth of strawberries. Cutting and baling of hay was delayed in coastal areas but proceeded normally in inland sections where higher temperatures and adequate sunshine prevailed.

Weather conditions continued generally favorable for all crops in the San Diego area. Persistent cloudiness in coastal districts was beneficial for retaining soil moisture. The general lack of precipitation resulted in an increase in irrigation water requirements.

In the Imperial Valley warm weather was generally favorable for crops.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a State basis. There will be no duplication of numbers within a state

Figures and letters following the station name such as 17 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed 'No. of Days .01 or more' in Table 2, have been changed to 'No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published are for the 24 hours ending at time of observation. See the Station Index for observation time

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a.m., PST, except for Bishop WB AP which is 10 30 a.m., PST and Blue Canyon WB AP 6 00 a.m., PST WTR EQUIV in table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7 are necessarily taken from different points for successive observations, consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain

B Adjusted to a full month

C In the 'Refer to Tables' column in the Station Index the letter 'C' indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall

M One or more days of record missing, see Table 5 for detailed daily record Degree Day data is carried for this station have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements made at irregular intervals will be published in the July or later or delayed data December issue of this publication

SS This entry in time of observation column in Station Index means Sunset.

T Trace, an amount too small to measure.

V Includes total for previous month

VAR This entry in time of observation column of Station Index means variable

Subscription Price 15 cents per copy, mailed to any address in the United States for $1.50 per year (Postal Union countries, $2.00). Checks and money orders should be made payable to the Superintendent of Documents. CHATTANOOGA: 1954

CALIFORNIA - JUNE 1954

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 315 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 68.1° or 1.5° below the weighted mean. The unweighted average temperature based on the same 315 stations was 65.8° or 1.7° below the unweighted mean. The highest temperature for the month, 125°, which occurred at Cow Creek in Death Valley on the 22d equaled the highest temperature for June of 1950 which occurred at Cow Creek on the 30th, and was exceeded for June only by the maximum temperature of 129° reported at Volcano Springs in the Imperial Valley on June 23, 1902. Twin Lakes in Alpine County at an elevation of 7829 feet recorded the lowest temperature, 19°, on the 5th and 6th.

The average precipitation for the State based on 321 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.58 inch or 0.28 inch above the weighted mean. The unweighted average based on the same 321 stations was 0.59 inch or 0.28 inch above the unweighted mean. Based on 535 stations listed in Table 3, the unweighted average was 0.58 inch or 0.27 inch above the unweighted mean. Klamath in Del Norte County, at an elevation of 25 feet, recorded the greatest monthly total precipitation, 5.92 inches. The greatest daily precipitation amount, 2.20 inches, was recorded on the 15th at Orick Prairie Creek Park in Humboldt County, at an elevation of 161 feet. Ninety-six stations, mostly in southern California, recorded no precipitation, and 51 stations only a trace of precipitation.

Snowfall during June was generally much above normal in the Sierra Nevada. Blue Canyon WB AP at an elevation of 5280 feet in Placer County reported the greatest monthly snowfall, 8.0 inches. This was the greatest June total snowfall on record at this station for the period of record. Grant Grove at an elevation of 6580 feet in Tulare County recorded a total of 7.5 inches and Twin Lakes a total of 7.3 inches. The June total snowfall for Twin Lakes was the greatest since 1945 when 17.0 inches occurred. At Big Creek Powerhouse No. 1 at an elevation of 4928 feet in Fresno County a total of 6.0 inches was recorded as the greatest for June since 1933 when 8.5 inches of snowfall occurred. At Huntington Lake in Fresno County at an elevation of 7020 feet, 6.0 inches of snowfall was the greatest recorded for June since 1925 when 9.0 inches was reported. At Soda Springs at an elevation of 6750 feet in Nevada County the total of 4.0 inches for June was the greatest snowfall since 1950 for this month when a total of 5.0 inches occurred.

Rains in the north coastal area during the first half of the month were beneficial for maintaining green feed on pastures and ranges and providing moisture for potatoes and other growing crops but were detrimental to sheep-shearing operations and hay-making activities.

Light rains in the central coastal area during the first half of the month resulted in some damage to strawberries and slowed harvesting of barley and other grains. Drying winds immediately following the light rains minimized damage to ripening cherries. Cool weather during the first half of the month retarded development of some crops. Warm, dry weather during the last half of the month was favorable for rapid development of deciduous fruits. Hot weather from the 20th to the 22d resulted in some sunburn damage to strawberries in Santa Cruz County and to apricots in Monterey and Santa Clara Counties. In Sonoma County hot weather resulted in losses to poultry and severe damage to bushberries and Gravenstein apple crops. Generally conditions were favorable for harvesting of grain and hay crops. Warm, dry weather with a heavy cover of dry grass on pastures and range lands resulted in a serious fire hazard.

Light showers in the upper Sacramento Valley during the first week retarded alfalfa haying and temporarily delayed grain-harvesting operations. Well-below normal temperatures occurred during the first week with killing frosts reported from the 4th to 6th. Considerable fruit was reported frozen in mountain valleys. Mc Cloud reported a minimum temperature of 24° on the 6th, and Weed an unofficial low of 26° on the 4th. Light rains during the second week resulted in further damage to cut and baled alfalfa hay and continued unfavorable for grain harvesting. Pastures, however, were benefited from the rains. Continued cool weather delayed ripening of apricots and slowed growth of feed on irrigated pastures. Spraying and dusting for grasshopper control was frequently hindered by strong winds during the first half of the month. Hot, dry weather from the 20th to the 23d was beneficial for grain harvesting and ripening of early peaches. Although the average temperature for the month at Red Bluff was 2.9° below normal, the daily maximum temperatures of 109° on the 21st and 107° on the 22d were the highest on record for those dates at that station. The daily minimum temperature on the 6th, 47°, equaled the lowest temperature of record for that date. The average daily temperature of 94° on the 21st was within 2° of the highest average temperature on record for June at Red Bluff.

Cool weather during the first half of the month together with above-normal relative humidities in the lower Sacramento Valley was favorable for development of blight in pears and mildew in grapes and apples. Although cool weather was unfavorable for growth and development of rice, the mild temperatures were favorable for sizing of peaches and pears. Hot weather from the 20th to 23d resulted in some sunburn damage to walnuts, grapes, and apricots, but generally improved conditions in rice and sugar beet fields. Weather during the last half of the month was favorable for harvesting of the third crop of alfalfa. Although pastures and ranges at higher elevations were dry, good forage was reported with livestock in very good condition. At Sacramento the daily maximum temperature was below normal on 15 of the first 17 days of the month and above normal on 9 of the last 13 days. The maximum temperature of 104.7° on the 21st was only 0.3° below the highest temperature recorded for that date in 1936 at that station.

Much-below normal temperatures in the lower San Joaquin Valley from the 5th to the 10th were unfavorable for optimum growth of cotton and ripening of fruits. Some rain damage occurred to hay which had been cut. Winds and rains prevented dusting operations on some days. Strong winds also resulted in some losses in ripening plums, peaches, and apricots, and interfered with sulphuring of vineyards where some mildew developed as a result of wet weather on the 8th and 9th. Hot weather from the 21st to 23d was very favorable for cotton, watermelons, and cantaloupes, but detrimental to grapes with considerable sunburn damage reported to all types of grapes, particularly on sandy soils. Some sunburn damage was also reported to plums and Nectar peaches. At Fresno the daily minimum temperature of 46° on the 6th and 10th was the lowest ever recorded on those dates at that station. Also the maximum temperatures of 106° and 108° on the 21st and 22d, respectively, were the highest ever recorded on those dates at Fresno.

Continued below-normal temperatures in the upper San Joaquin Valley from the 4th to 19th retarded the growth of cotton but generally favored development of other crops and harvesting activities. Much-above normal temperatures from the 21st through 23d were beneficial for cotton but detrimental to most fruits with considerable sunburn damage reported. Sunscald damage was reported to grapes and estimated at 15 per cent to 20 per cent of the crop with some individual vineyards sustaining even greater losses. The minimum temperature of 45° on the 10th was the lowest ever recorded in June at Bakersfield and the daily maximum temperature of 109° on the 21st, 22d, and 23d resulted in the most severe hot spell at Bakersfield in four years.

Weather in the Santa Maria area during the first week was generally favorable for crops except for strong winds which resulted in some damage to crops. The lower frequency of night and morning fog was favorable for lettuce and strawberries. Light rains on the 8th and 9th resulted in only light damage to strawberries. The weather during the remainder of the month was generally favorable for crops except for strong winds which resulted in some damage. Pastures and ranges became quite dry, and the danger of fire increased by the end of the month.

Moderately warm weather in coastal sections and warm, sunny weather in the interior in the Los Angeles area were generally favorable for growing and maturing of crops. Irrigation water requirements increased during the month. At Bell Mountain, about 8.5 miles NE of Victorville, in San Bernardino County, a period of thunderstorm activity from about 2:00 p.m. to 4:30 p.m. on the 25th accompanied by strong winds, hail, heavy rains, and a tornado resulted in considerable damage to frame houses, garages, and other buildings. The storm moved from the Lucerne-Apple Valley district in a northerly to northwesterly direction through Bell Mountain toward Barstow. Several people observed the large, black, funnel-shaped cloud which resulted in the destruction of a residence. The Postmaster at Bell Mountain reported that hail and heavy rain broke windows and that flash-flood runoff cut a deep gully behind the Post Office building washing up a heavy gas tank which was buried in the ground. It was reported that water rushed by like a roaring river for at least one hour after the storm passed.

Φ DATA IN THE COLUMN HEADED "NO. OF DAYS .01 OR MORE" HAVE BEEN CHANGED TO "NO. OF DAYS .10 OR MORE" EFFECTIVE JANUARY 1, 1954.

WEATHER SUMMARY (Continued)

Several people lost livestock including chickens, and a number of cars were stalled in the flood waters. A brilliant display of lightning continued during the storm. The path of the storm was estimated as three miles in width and 35 miles in length.

In the San Diego area June was characterized by cloudy, dry weather. Fifty per cent of possible sunshine recorded at San Diego was eleven per cent below the average. Generally crops progressed under favorable weather conditions. Cool, cloudy weather, however, retarded the maturity of some summer variety avocados.

Strong winds in the Imperial Valley during the second week resulted in some slight damage to cotton, melons, and alfalfa, and cool weather retarded ripening of watermelons and cantaloupes. Otherwise, weather conditions were generally favorable for all crops and harvesting activities.

At Bishop WB Airport in Inyo County at an elevation of 4108 feet the maximum temperature of 109° on the 22d equaled the highest temperature on record at that station recorded in August 1898. The maximum temperature of 105° on the 21st and 24th equaled the highest temperature on record for June established in 1950. The minimum temperature of 32° on the 10th was the lowest June temperature recorded since 1944 when the lowest June temperature of record occurred as 28°.

CORRECTED DATA

MAY 1953		TABLE 2: State precipitation departure from normal should be +.53.
JULY 1953	WILLITS HOWARD RS	TABLE 2 DELAYED DATA, DECEMBER 1953: Precipitation departure from normal should be +1.36.
AUGUST 1953	CEDARVILLE	TABLES 2 & 3: Precipitation on 3rd, 13th, 14th, 24th, 29th and 30th should be .00 and monthly total .00.
NOVEMBER 1953	BERKELEY	TABLES 2 & 3: Precipitation on 5th should be .00; 10th, .11; 13th, .33; 14th, .17; 21st, .06 and 22nd, .02. Monthly total should be 2.16, departure -.25 and greatest day .77 on 14th.
		COMPARATIVE PRECIPITATION DATA - NORTH COASTAL AREA (SPECIAL TABLE), PAGE 266: Greatest Daily Precipitation Total and Date for Klamath should be 9.82 on January 17, 1953.
DECEMBER 1953	BERKELEY	TABLES 2 & 3: Precipitation on 3rd should be .24; 4th, .09; 6th, .08; 7th, .13; 18th, .01; 19th, .05 and 20th, .07. Monthly total should be .71, departure -3.40, greatest day .24 on 3rd and days with .01 or more 8.
ANNUAL 1953	ANTIOCH 1 E	TABLE 3: No. of days between dates, 32° or below, should be 247.
	BERKELEY	TABLE 2: Precipitation monthly total for November should be 2.16, departure -.25. December should be .71, departure -3.40; Annual total should be 14.84 and departure -8.81.
JANUARY 1954	BERKELEY	TABLES 2 & 3: Precipitation on 16th should be .79; 17th, 1.17; 23rd, .34; 31st, .01 and greatest day 1.17 on 17th.
FEBRUARY 1954	BERKELEY	TABLES 2 & 3: Precipitation on 13th should be .91; 14th, .58 and 16th, .05. Monthly total should be 2.92, departure -1.39 and greatest day .19 on 13th.
	OAKDALE WOODWARD DAM	TABLE 2: Precipitation departure from normal should be -1.43.
	YORBA LINDA	TABLE 3: Precipitation on 18th should be .01.
	YOSEMITE	TABLE 3: Delete .01 on 18th; 17th should be .53; 18th should be .63.
	YREKA	TABLE 2: Greatest daily precipitation should be .85 on 13th. TABLE 3: Delete .53 on 17th and .63 on 18th; should be .15 on 17th and .14 on 18th.
	YUCCA GROVE	TABLE 3: Delete amounts on 17th and 18th, should be zero.
MARCH 1954	LA CRESCENTA	TABLE 3: Delete entire precipitation record and add the following record: 16th, .58; 17th, .90; 20th, 1.15; 21st, .10; 22nd, .58; 24th, .30; 25th, .46; 29th, .18; 30th, 1.43 and monthly total 5.68.
	LECHUZA PATROL STATION	TABLE 3: Delete entire record, daily record should be: 16th, .70; 17th, .40; 19th, Trace; 20th, 1.70; 21st, .03; 22nd, .08; 24th, .15; 25th, .17; 29th, .05; 30th, 2.00 and monthly total 5.28.
	MOJAVE	TABLE 3: Precipitation on 30th should be Trace and monthly total .99.
APRIL 1954	ALISO CANYON	TABLE 3: Precipitation on 28th should be .45 and monthly total .47.
	CALEXICO	TABLE 3: Precipitation on 28th and 29th should be .00 and monthly total .00.
JANUARY 1954		Add the minus sign to minimum temperatures in Table 5 on the 8th for these stations: Sierraville RS and Soda Springs.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTED DATA WILL BE FOUND ON PAGE 152.

CHATTANOOGA: 1954

CALIFORNIA - JULY 1954

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 312 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 76.7° or 1.0° above the weighted mean. The unweighted average temperature based on the same 312 stations was 74.1° or 0.8° above the unweighted mean. The highest temperature for the State, 123°, occurred at Greenland Ranch in Death Valley on the 31st. Mount Hebron Ranger Station at an elevation of 4250 feet in Siskiyou County, reported the lowest temperature, 27°, on the 21st.

The average precipitation for the State based on 326 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.13 inch or 0.03 inch above the weighted mean. The unweighted average precipitation based on the same 326 stations was 0.10 inch or 0.02 inch above the unweighted mean. Based on 533 stations listed in Table 3, the unweighted average was 0.09 inch or 0.01 inch above the unweighted mean. Cuyamaca at an elevation of 4677 feet in San Diego County reported the greatest monthly total precipitation, 2.14 inches. Snow Creek Upper at an elevation of 1940 feet in Riverside County, recorded the greatest daily precipitation, 1.08 inches, on the 13th. Two hundred fifty-one stations scattered throughout the State reported no precipitation, while 93 stations reported only a trace. Much-above normal precipitation amounts occurred in the southeastern interior and some south coastal districts, with some stations reporting the greatest monthly and daily amounts on record.

Light precipitation in the north coastal area was not sufficient to benefit crops. Range lands and forests continued drying rapidly, and fire danger increased.

In the central coastal area during the first three weeks weather was generally favorable for crops and harvesting activities. On the 24th and 25th a severe thunderstorm accompanied by severe lightning passed through Sonoma County leaving several hundred blown transformers and fuses and many damaged television sets in its path. The storm was reported by the Pacific Gas & Electric Company as one of the worst electrical storms in the history of the area. According to reports the storm entered Sonoma County near Tomales about midnight on the 24th and moved northward through Sebastopol to Healdsburg, and then passed toward the east over The Geysers and on into Lake County where it was reported responsible for starting at least three forest fires in the early morning. Much-above normal temperatures on the 27th and 28th were unfavorable for some crops. In Sonoma County high temperatures contributed to dropping of blossoms on string beans. In Santa Clara County extreme heat resulted in sunburn damage to exposed grapes and some damage to prunes and tomatoes. In Napa County high temperatures caused some sunburn damage to walnuts and prunes, and in San Benito County heat injury was sustained in walnuts and prunes. Some sunburn damage was reported to lettuce and tomatoes in Monterey County.

In the upper Sacramento Valley moderate temperatures during the first three weeks were generally favorable for crops; however, strong winds on some days were detrimental to spraying operations for pest control. High temperatures and low relative humidities during the last week resulted in extremely dry conditions in grasses and other vegetation with many grass and brush fires reported. Ranges and pastures at higher elevations dried rapidly. The average wind speed of 8.9 mph at Red Bluff was the highest average wind speed on record for July at that station.

Moderate temperatures in the lower Sacramento Valley during most of the month were very favorable for all crops and farming activities. Below-normal temperatures were favorable for sizing of pears and tomatoes, and sugar beets made satisfactory growth. Desiccating, northerly winds on the 21st, 22d, and 28th were unfavorable for harvesting of alfalfa hay due to excessive losses of leaves under the dry conditions. High temperatures on the 27th and 28th were generally unfavorable for growth and development of most crops. Considerable sunburn damage was reported on walnuts, and some sunburn on tomatoes and grapes. The daily maximum temperature of 107° at Sacramento on the 28th was the highest temperature recorded since September 1950 and was the highest temperature on record for that date at that station.

Weather in the lower San Joaquin Valley was generally favorable for all crops and harvesting activities. Below-normal temperatures during the early portion of the month prolonged harvesting of stone fruits and resulted in an orderly flow of tomatoes and melons to market.

Although daily maximum temperatures in the upper San Joaquin Valley averaged generally below normal, nights were warm, and growing conditions were nearly ideal for most crops.

Night and morning low clouds and fog in the Santa Maria area were reported unfavorable for lettuce. High temperatures on the 28th resulted in some sunburn damage to strawberries. Otherwise, weather conditions were favorable for crops. In the Santa Barbara area temperatures averaged much above normal, due, in the main, to high daily minimum temperatures.

Warm, humid weather in the Los Angeles area was generally favorable for most growing crops. Despite high daytime temperatures, Valencia oranges and avocados, for the most part, developed satisfactorily. Black-eye beans matured rapidly, and tomatoes made excellent growth. Hot weather on some days, however, was unfavorable for lima beans. Scattered showers occurred in the Los Angeles area from the 12th to 19th with locally heavy thundershowers during the evening of the 16th in the Antelope Valley. Some damage was reported to deciduous fruits in the Beaumont district as a result of strong winds on the 13th and 16th. On the 16th a freak electrical rain and windstorm caused extensive structural damage in the Antelope Valley east of Lancaster. The storm which carved a path of destruction approximately three miles wide and an unknown number of miles long was described as like a tornado. Trees, barns, chicken houses, and television antennae were downed by the strong winds. Thundershowers in the Beaumont and Yucaipa districts on the 24th resulted in further damage to the remainder of the plum crop and resulted in blowing of some peaches from trees. Much-above normal temperatures prevailed in the Los Angeles area due, in the main, to high daily minimum temperatures. At Los Angeles July was the second warmest month and also the second warmest July on record at that station. At Burbank July with an average temperature of 78.2° was the warmest month on record. The previous highest average monthly temperature, 76.2°, occurred in August 1945 and July 1953. The daily maximum temperature of 104° at Burbank on the 7th was the highest temperature recorded at that station since the daily maximum temperature of 104° on September 7, 1949.

In the San Diego area crops and harvesting activities progressed under favorable weather conditions. At San Diego the average monthly temperature, 71.9°, was the second warmest on record for July at that station. The daily maximum temperatures of 86° on the 7th and 83° on the 17th were the highest temperatures ever recorded on those dates at San Diego. Much-above normal temperatures prevailed at other stations in the vicinity due, for the most part, to high daily minimum temperatures. Scattered showers occurred in mountain districts during the last half of the month, but little or no precipitation occurred in agricultural districts.

Well-above normal temperatures also prevailed in the southeastern interior. In the Imperial Valley crops continued to make satisfactory growth under hot and humid conditions. Generally, high daily minimum temperatures resulted in the much-above normal monthly temperatures at many stations scattered throughout the area. The monthly total precipitation at Cow Creek in Death Valley, 0.64 inch was the greatest monthly total for July for the period of record. The previous greatest monthly total amount, 0.5 inch, occurred in 1950. The greatest daily precipitation amount at Cow Creek, 0.62 inch, on the 26th exceeded the previous greatest daily amount on record, 0.48 inch, which occurred on July 26, 1950. At Greenland Ranch, also in Death Valley, the greatest monthly total precipitation amount and also the greatest daily precipitation amount 0.75 inch, on the 26th exceeded the previous greatest monthly and daily precipitation amount on record, 0.70 inch, recorded on July 26, 1950. On the 13th a severe windstorm in the Palo Verde Valley with winds reported up to 60 - 70 mph resulted in damages estimated at $200,000. The storm which appeared shortly after 8:00 p.m., moved out of the southeast from Arizona and struck Heron Field and demolished a 300 by 50-foot hangar and numerous planes. Considerable property was damaged in a residential area, and losses to alfalfa growers was estimated at $5,000. Alfalfa which had been cut for hay was blown away or scattered widely over the area. Television antennae were wrecked; power lines broken; and many trees downed. Many telephone lines were broken as trees fell over the wires. In some places strong winds and telephone wires snapped large poles with ease. In some cases the cross arms on the poles were broken. The storm was reported as one of the most damaging that ever occurred in the Palo Verde Valley.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m. PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing, see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

\+ Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

AUGUST 1954
Volume LVIII No. 8

CHATTANOOGA: 1954

CALIFORNIA - AUGUST 1954

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

Unprecedented cool weather occurred in the Central Valley and northern interior portions of the State, particularly in the Sacramento Valley. At many stations average temperatures fell below the previous record-lowest averages for August. The average temperature for the State based on 314 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 71.3° or 3.2° below the weighted mean. The unweighted average based on the same 314 stations was 69.0° or 3.3° below the unweighted mean. Based on unweighted average temperatures published in Table 1, August 1954, with an unweighted average of 69.0°, was the coolest on record since 1897. This record-low mark fell below the previous low of 70.0° established for August in 1941 by 1.0°. Other years in which low August average temperatures for the State as a whole obtained were 1876, 1899, 1911, 1912, 1924, 1925, 1927, 1943, 1947, and 1948. The highest temperature for the State, 120°, was recorded in Death Valley at Greenland Ranch on the 1st and 30th and at Cow Creek on the 31st. The lowest temperature, 24°, was recorded at Tulelake in Siskiyou County on the 29th and also at Boca in Nevada County on the 16th. At Fort Bidwell in Modoc County the average daily maximum temperature, 81.1°, established a new record-low average daily maximum for August which fell below the previous record-low value of 81.8° which occurred in 1912 and again in 1941. The average daily temperature, 62.2°, became the second lowest on record for August exceeding the average of 60.8° in 1912. The average daily minimum, 43.2°, was also the second lowest average daily minimum for August with the record-lowest, 39.9°, recorded in 1912.

A very unusual storm during the last week brought unprecedented heavy precipitation to many stations in the north coastal area, Sacramento Valley and northern mountain areas. At many stations the previous record-greatest daily totals and previous record-greatest monthly totals for August, which were, for the most part, established only last year in 1953, were surpassed by a wide margin. Unquestionably, this was one of the heaviest and most widespread storms for this time of year in the climatological history of northern California. The average precipitation for the State based on 320 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.33 inch or 0.18 inch above the weighted mean. The unweighted average based on the same 320 stations was 0.33 inch or 0.22 inch above the unweighted mean. Based on 528 stations listed in Table 3 the unweighted average was 0.37 inch or 0.26 inch above the unweighted mean. In the southern half of the State monthly precipitation totals were, with a few exceptions, much below normal. Two-hundred fifteen stations, mostly in the southern half of the State, reported no precipitation, and 72 stations recorded only a trace.

Cazadero, at an elevation of 1040 feet in Sonoma County, reported not only the greatest daily total precipitation, 3.65 inches, on the 27th but also the greatest monthly total, 7.13 inches. Furthermore, the greatest daily total was the greatest for the State for August since 1938 when 3.80 inches occurred at Seven Oaks in San Bernardino County on the 7th and the third greatest since 1904 when a total of 5.00 inches occurred at Laguna Valley in San Diego County on the 22d. The greatest monthly total precipitation, 7.13 inches, was the greatest recorded for the State for August since 1944 when a total of 8.06 inches occurred at Warner Springs in San Diego County and the third greatest on record since 1909 when a total of 7.21 inches occurred at Needles in San Bernardino County. All of these amounts are based on the period of record beginning with 1897.

For comparative precipitation amounts refer to the special table, Comparative Precipitation Data for Northern California - August 1954, on page 198. Also, refer to the special comparative table on page 189, Climatological Data, California - August 1953.

Heavy rains in the north coastal area on the 27th and 28th were very beneficial for crops, particularly range grasses. At Eureka, August with a total of 1.24 inches of precipitation, was the wettest since 1924 when 1.03 inches of rain fell during the month and the second wettest since 1907 when 2.66 inches was recorded. At Upper Mattole, also in Humboldt County, the monthly total of 3.46 inches exceeded by a considerable amount the previous record amount for August of 1.62 inches in 1907 and also the amount of 1.58 inches for 1953. The greatest daily amount at Upper Mattole, 2.02 inches, recorded on the 28th, surpassed previous greatest daily amounts, 1.51 inches and 0.93 inch, recorded on August 9, 1907 and August 26, 1953, respectively.

Cooler weather in the central coastal area following the much-above normal temperatures late in August were beneficial for all crops. Temperatures, however, were too low for optimum prune-drying conditions in the Santa Clara Valley. Heavy rains in Sonoma County on the 27th and 28th resulted in losses to the prune crop of disasterous proportions. There was much splitting of prunes on the trees, and the development of brown rot added to the losses. Hop harvesting was getting under way when the heavy rains hit, and the weight of the moisture and soaked conditions of the soils caused poles to fall and hops to rest on the ground in some fields with serious losses reported. Harvesting of string beans in Sonoma County was also delayed by the rains, thus lowering the quality. In Napa County rains interrupted some prune picking, and some prunes drying on trays had to be stacked. Strong winds on the 27th blew considerable quantities of prunes, pears, and peaches from trees. Monthly and greatest daily precipitation amounts at most stations in Sonoma County exceeded previous record amounts for August by extremely wide margins. In the previous wettest Augusts, 1916 and 1953, precipitation was only about 15 per cent of the 1954 amounts. At Cloverdale the 2.22 inches in August 1954 surpassed the 0.33 inch amount for 1953 and the previous record amount of 0.35 inch for 1916. Likewise, at Healdsburg, the 3.17 inches for 1954 surpassed the 0.45 inch amount for 1953 and the record amount of 0.52 inch for 1916. At Graton August amounts obtained as follows: 1954, 2.72 inches; 1953, 0.38 inch; 1916, 0.38 inch. At Santa Rosa the record-breaking monthly total precipitation of 1.35 inches surpassed the previous record amount of 0.32 inch established in 1916. The greatest daily precipitation of 1.15 inches recorded on the 28th set a new record exceeding the previous record of 0.22 inch on August 28, 1923 and 0.20 inch on August 14, 1916. Normal precipitation for August at stations listed above is 0.01 inch at Cloverdale and Healdsburg and 0.02 inch at Santa Rosa and Graton. The most outstanding event, of course, was the record-breaking precipitation at Cazadero also in Sonoma County and referred to above.

Much-below normal temperatures in the upper Sacramento Valley slowed ripening of peaches and retarded some harvesting operations. Unusually heavy rains during the last week interrupted harvesting of peaches, almonds, and prunes as well as haying operations. Considerable damage occurred to prunes due to brown rot and splitting. Rains, however, benefited irrigated pastures and meadows and contributed to reduced fire danger in forests. Range feeds started to grow following the rains. At Red Bluff WB Airport in Tehama County precipitation was much above normal and average temperatures much below normal with several long-standing records equaled or broken. The daily minimum temperature of 55° on the 13th equaled the lowest temperature for that date at that station, and the daily maximum of 65° on the 28th was the lowest daily maximum on record for that date. The average temperature, 75.0°, was the second lowest average for the Red Bluff area for August since 1899 when an average of 73.8° obtained. Lower average daily minimum temperatures occurred in August in four other years of record: 57.1° in 1946; 58.2° in 1945; 58.4° in 1943; and 60.0° in 1899. The previous lowest average daily maximum temperature at Red Bluff for August, 87.0°, occurred in 1899. At Orland in Glenn County the average daily maximum temperature, 88.5°, was the lowest for August since 1914 when an average daily maximum of 86.8° was recorded; the average daily temperature of 72.6° was the lowest since 1914 when an average of 71.0° obtained; and the average daily minimum of 56.6° equaled the average for August 1911 and was the third lowest on record for August exceeding the averages of 55.1° for 1914 and 55.7° for 1949. At Chico Experiment Station in Butte County the highest temperature for the month, 99°, was the lowest maximum on record for August by 3°. The previous lowest August maximum, 102°, occurred in 1911, 1880, and 1881. The average daily maximum temperature, 87.5°, was also the record lowest with the second and third record-lowest average daily maximums recorded as 88.4° in 1953 and 89.4° in 1949. Although the lowest temperature and the average daily minimum temperature were not record-breaking values the average daily temperature, 71.9°, was the new record lowest for August with the second, third, fourth, and fifth record-lowest values for August occurring as follows: 1949, 73.0°; 1953, 73.1°; 1899, 73.2°; 1876, 73.6°. At Mount Shasta WB City August was the coolest on record since 1908 and the second wettest since 1888 exceeded only by the total of 4.16 inches in 1902. Heavy snow fell on Mount Shasta above the 7500-foot level on the 27th and 28th. At McCloud also in Siskiyou County, the total monthly precipitation of 3.76 inches and greatest daily amount of 2.12 inches exceeded the previous record-greatest amounts of 1.53 inches and 1.13 inches, respectively, established in 1917. At Orland in Glenn County the total of 1.06 inches

of precipitation for the month established a new record surpassing the amount of 0.41 inch for 1953 and 0.37 inch for 1896 at that station. The greatest daily total, 1.03 inches, also set a new record for August exceeding the 0.29 inch for August 30, 1953.

Unusually cool weather in the lower Sacramento Valley accompanied by high relative humidities and accentuated by heavy rains during the last week resulted in considerable losses to peach growers in the "Peach Bowl" area consisting of Sutter, Yuba, Butte, and Colusa Counties. The heavy rains fell in the midst of the harvesting and resulted in tremendous losses. The expected tonnage of over 200,000 tons was reduced to about 150,000 tons with losses estimated at about three million dollars. The only appreciable damage reported from the rains was to cling peaches, and it was manifested by loosening of the ripening fruit at the stem causing it to fall and activation and spread of brown rot. Crops other than peaches received little or no damage from the rains. Fruit-drying operations were retarded, and harvesting of seed crops was slowed as a result of the rains. A report from the Liveoak district near Sacramento indicated the occurrence of some ground fog in some places in Sutter and Butte Counties. This was the first report of fog at this time of year in the memory of reporters of this district. The period of unsettled weather from the 25th to the 28th brought unprecedented heavy precipitation amounts to some stations for August. At Colusa 1 SSW the total of 0.52 inch set a new record for August exceeding the previous record total of 0.33 inch for August 1878. At some stations the unusually heavy showers in August 1953 resulted in the greatest August total precipitation on record. Prior to 1953 heavy precipitation was noted in records for August in 1878, 1896, 1899, 1904, 1916, 1925, and 1947. For further details refer to the special Table of Comparative Precipitation Amounts for August 1954 for stations in the "Peach Bowl" area on page 198. Dunsmuir Ranger Station in Shasta County reported a new record total for August, 3.30 inches, surpassing the previous record amount of 1.71 inches in 1913 and the previous second greatest amount of 1.04 inches for 1953. At Sacramento WB City the average daily maximum temperature, 85.4°, was the lowest since 1925 when an average of 85.2° obtained and the seventh lowest on record since 1880. The record lowest, 81.9°, occurred in 1899 at Sacramento. The total precipitation for August at Sacramento WB City, 0.35 inch, was exceeded only once when 0.67 inch was recorded in 1953.

Weather in the lower San Joaquin Valley was generally ideal for most agricultural activities, but temperatures were too low for optimum crop-growing conditions. Much-below normal temperatures retarded maturing of grapes and kept the sugar content low. High relative humidities were unfavorable for figs which ripened during the latter half of the month. August was the coolest on record at Fresno WB Airport. The average temperature, 74.5°, was 0.6° lower than the previous record low for August of 75.1° recorded in 1899. Also, both the average daily maximum temperature and average daily minimum temperature were lower than previous record values for August at that station. The daily maximum temperature, 82°, on the 14th equaled the previous record-lowest daily maximum for that date and the daily maximum temperatures of 83°, 82°, and 75° on the 13th, 20th, and 25th, respectively, established new record-low daily maximums for those dates. The daily minimum temperatures, 53° and 54°, on the 13th and 21st, respectively, equaled the previous record-low daily minimum temperatures for those dates, respectively, and the daily minimum of 53° on the 15th, 16th, and 26th established a new record-low daily minimum for those dates at Fresno. At Lindsay in Tulare County the highest temperature, 101°, and the average daily maximum temperature, 92.1°, equaled the previous record lowest daily maximum and average daily maximum for August at that station established in 1953. In addition, the average temperature, 73.6°, established a new record by falling below the previous record low of 74.4° for 1947. The average daily minimum temperature, 55.1°, was the second lowest on record exceeding the record lowest of 55.0° for 1947 and 1943. Although the average daily maximum temperature at Porterville in Tulare County, 92.6°, equaled the average daily maximum for 1941 but exceeded the record-lowest average daily maximum established in 1953, the average daily temperature, 74.7°, set a new low record by falling below the average of 75.1° for 1953, and the average daily minimum temperature, 56.7°, set a new low record by falling below the previous record low of 57.1° for 1930 at Porterville. All amounts refer to the month of August.

Much-below normal temperatures in the upper San Joaquin Valley slowed the growth of cotton. At Bakersfield the average daily temperature, 77.2°, equaled the average for August 1953 and was the fourth lowest on record for August exceeding the 74.4° for 1899, 75.6° for 1912, and 76.4° for 1911. The average daily maximum temperature was the third lowest on record, and the average daily minimum temperature was the fourth lowest for the Bakersfield vicinity for August.

In the Santa Maria area night and morning fog together with low-lying cloudiness on some days was unfavorable for lettuce during the early portion of the month. Some heat damage was reported to walnuts in the Santa Barbara and San Luis Obispo districts. Otherwise, weather conditions were generally favorable for crops.

Cool weather in the Los Angeles area during the month was favorable for pest-control operations and some reduction in irrigation water requirements. Hot weather and low relative humidities during the last several days curtailed pest-control activities and increased irrigation water demands.

Weather in the San Diego area was generally favorable for all crops and harvesting activities. Near normal temperatures prevailed at San Diego until the last several days when well-above normal temperatures obtained. The daily maximum temperature of 88° on the 30th was the highest temperature recorded at San Diego this summer.

In the Imperial Valley a severe electrical storm struck during the night of the 31st and resulted in considerable damage to property and utilities. Calipatria and Niland were treated to a brilliant electrical display that would rival any Fourth of July celebration, it was reported. The storm which brought wind, rain, and lightning hit suddenly with little previous warning about 9:30 p.m. and continued to about midnight. Aside from a few trees blown down and television antennae bent, little damage was reported at Calipatria. However, at Niland, about 10 miles to the north, considerable damage was reported to newly-constructed properties. In some districts power transformers went out, and power poles went down. Some cotton which was ready for picking was blown to the ground, and young tomato plants were damaged. Numerous flash floods were reported. In the Coachella Valley at Indio and Thermal strong winds blew water in under doors of some stores with some damage to stock. In the Palm Springs area heavy rains fell for about 40 minutes, it was reported. At Indio and Blythe a sudden heavy rain caused temporary power disturbances. Some highways and roads were temporarily impassable.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual: $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

CALIFORNIA

SEPTEMBER 1954
Volume LVIII No. 9

CHATTANOOGA: 1954

WEATHER SUMMARY

Temperatures during September averaged below normal in all areas except the South Coast Drainage where a slight excess was recorded. The Central Valley generally reported a cool September, although there was little cloudiness. Precipitation was deficient in all areas on an average; only the North Coastal Drainage had enough reporting points with substantial excesses to bring the divisional average fairly near the normal value. Weather was generally favorable for the development of late-growing field crops and for the development and harvest of fruit and nut crops, although the cool weather tended to delay the maturing of seed crops, and to reduce yields of some other crops in some areas. Critical conditions from the point of view of fire hazard in forested areas were restricted for the most part to the period from the 23d through the 27th, generally over the Sierras and in southern California.

The average temperature for the State based on the 320 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 68.8°, 0.9° below the weighted normal. The unweighted average for the same stations was 67.0°, 1.1° below the unweighted normal. The highest temperature for the State was 116° recorded at Cow Creek on the 1st; the lowest was 14° recorded at Boca on the 18th and 30th. The second decade of the month was particularly cool except on the coast. Interior valley and mountain stations reported daily average temperatures much below normal during this period; there was general cooling again over the entire State after the 27th. The period from the 23d to the 27th was abnormally hot in all areas, contributing to the high danger of forest fires. Mean monthly temperatures ranged from the high of 91.6° at Cow Creek to the low of 48.8° at Twin Lakes. Fresno recorded a monthly mean temperature of 71.2°, 2.3° below normal, making this the coldest September since 1941. A new record low temperature for the 16th, 49°, was established there. Mount Shasta, with a monthly mean temperature of 57.1°, also recorded the coolest September since 1941. Sacramento's monthly mean of 69.6° was the lowest since 1942. Stations in coastal areas, on the other hand, reported monthly average temperatures near or substantially above normal. The warm spell during the latter part of the month produced some record high temperatures in the San Francisco Bay Area. The 92° on the 24th and the 93° on the 25th were the highest temperatures of record on those dates since 1871. During the hot spell from the 17th to the 27th in the Burbank area, numerous forest and brush fires occurred in the nearby foothills and mountains. Critical conditions for forest fires existed over the Sierras and southern California generally during the hot weather which was most severe between the 23d and 27th, and a number of fires were reported.

The average precipitation for the State based on the 327 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.16 inch, 0.19 inch below the weighted normal. The unweighted average based on the same stations was 0.14 inch, 0.20 inch below the unweighted normal. The unweighted average based on the 539 stations appearing in Table 3 was 0.13 inch, 0.21 inch below the unweighted normal. The greatest monthly total recorded wholly within the month of September was 2.61 inches at Klamath. Cuyamaca recorded a total of 3.25 inches during the month, but 2.62 inches of the amount was recorded on the morning of the 1st, covering a storm which began on the last day of August, with the exact distribution by dates unknown. 288 stations recorded no precipitation whatsoever, and an additional 53 stations recorded only a trace. The average of the precipitation totals in the North Coast Drainage was 89 percent of normal, making that area relatively the wettest in the State. The Sacramento Drainage had only 36 percent of normal precipitation, and the Northeast Interior Basins 26 percent. The San Joaquin and Central Coast Drainages were the driest areas of all. The San Joaquin averaged 5 percent of normal while the Central Coast averaged only a trace with only two stations receiving a measurable amount. The South Coast Drainage had 31 percent of normal precipitation, and the Southeast Desert Basins 55 percent. Even in the comparatively wet North Coast Drainage only eight stations recorded monthly totals in excess of 1.00 inch.

Reports from field stations and from the Office of the State Climatologist for selected areas present a picture of weather generally favorable for agriculture, although effects differed with respect to crop and locality. The generally dry conditions favored sun-drying of raisins and prunes in producing areas, although there had been some earlier damage to the prune crop from rains. In the lower Sacramento Valley, the cool weather during the first two-thirds of the month delayed the filling of rice and seed grains, and retarded the second tomato crop. However, the hot weather during the last decade was favorable for the maturing of the rice crop. In the fruit producing areas of the Sacramento Valley, the cool weather favored the sizing of pears and the maturing of apples to good color and quality. In the upper San Joaquin Valley weather was generally favorable for crops, although lack of sufficient dew was unfavorable for cotton defoliation operations with dust-form chemicals. Hand picking of cotton was progressing in most producing areas. In the potato-growing areas in the northern part of the State, harvesting was under way during the month, with some rain damage reported. In the Santa Maria area, weather was generally favorable for truck crops and garden vegetables, although the hot, dry weather toward the end of the month caused some sunscald on strawberries and peppers, and had a dessicating effect on plants generally. Irrigation requirements were increased. Similar reports were received from other areas. As the month ended, lettuce plantings were well under way in the Imperial Valley, with weather favorable for germination. There was some rain damage to the date crop in producing areas. The hot, dry weather in southern California interfered with pest control operations and caused heavy demands for irrigation water in citrus areas.

Three men lost their lives fighting a forest fire at Tunnel No. 6 near Sierra City during the high fire-danger period.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles Degree days are based on a daily average of 65° F.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days 10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations,consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

\- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CLIMATOLOGICAL DATA

CALIFORNIA

OCTOBER 1954
Volume LVIII No. 10

CHATTANOOGA: 1954

WEATHER SUMMARY

High barometric pressures along the coast and over the western plateau region during October resulted in mostly sunny skies with near normal temperatures throughout most of the State. Storms from the north Pacific brought some rain to the northern part of the State during the first half of the month but totals were only about one-half the normal for October. In the southern half of the State practically no precipitation occurred. Weather was generally favorable for growing and harvesting of crops but, by the end of the month, ranges were very dry and fire-danger in forested areas was abnormally high.

The average temperature for the State based on the 315 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 61.3°, 0.3° above the weighted normal. The unweighted average for the same stations was 60.2°, 0.2° below the unweighted normal. The highest temperature for the State was 106° recorded at Mecca on the 16th; the lowest was 6° recorded at Boca on the 30th. The first week was unseasonably cool in all areas except the South Coast Drainage, where temperatures were only slightly below normal. All of the areas experiencing this cool weather were compensated with well-above normal temperatures during the middle of the month. Record high temperatures for so late in the autumn occurred at many stations during this hot spell; among them Bakersfield with 101° on the 15th and 98° on the 16th, Fresno with 97° on the 15th and 94° on the 16th, and Sacramento with 91° on the 15th. Temperatures for the month in the S E Desert Basins averaged 2.0° above normal, which was the greatest departure from normal of any of the seven designated divisions of the State. Mount Shasta reported its first killing frost of the season on the 26th and Fresno reported light frost in the vicinity on the 25th, 26th, and 28th.

The average precipitation for the State based on the 324 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.26 inch, 1.04 inches below the weighted normal. The unweighted average based on the same stations was 0.25 inch, 1.13 inches below the unweighted normal. The unweighted average based on the 551 stations appearing in Table 3 was 0.26 inch, 1.12 inches below the unweighted normal. The greatest monthly total recorded was 4.50 inches at Gasquet Ranger Station. No precipitation whatsoever was recorded at 304 stations and an additional 36 stations recorded only a trace. By the end of the month Bakersfield reported 186 consecutive days without measurable precipitation, San Diego reported no measurable rain since June 13, and Burbank had the second successive season and the third season in the history of the station that no measurable precipitation occurred during the period from July 1st to October 31st.

Reports from field stations and from the Office of the State Climatologist indicate the weather was generally favorable for agricultural interests but effects differed somewhat with respect to crop and locality as outlined in the following paragraphs.

Rainy weather during first half of the month in the north coastal area was beneficial in forested districts, keeping the fire danger generally low. The rains were also very favorable for grasses on pastures and range lands as well as for cultivated fields, although the wet weather did delay some of the remaining potato-harvesting activities.

The weather in the central coastal area was generally favorable for growth and harvesting of crops except for the first week of the month which was too cool for optimum crop growth. Walnut and tomato harvesting was well advanced by end of month. Grape harvesting was nearing completion.

Rains during the first week in the upper Sacramento Valley interrupted some harvesting work and wet some hay and beans but was of benefit to ranges and irrigated pastures. The rain and accompanying strong winds assisted in the walnut harvest by causing hulls to swell and crack and knocking many to the ground. Drying winds during the latter part of the month were beneficial to bean, clover seed, and milo harvesting. By the end of the month ranges were very dry with grasses nearly dormant.

In the lower Sacramento Valley the rains early in the month caused some soft decay in tomatoes and delayed the harvest of rice and seed crops but was beneficial to ranges. The warm, dry weather during most of the latter part of the month was favorable for rice harvesting and maturing of tomatoes, beans, grapes and other crops.

Cool weather in the upper San Joaquin Valley during the first decade of the month slightly retarded the maturing of cotton. During the middle of the month high temperatures were favorable for cotton and alfalfa but unfavorable for potatoes. During the latter part of the month the weather was generally favorable for all crops except for some slight frost damage to sweet corn in the Lamont district.

In the lower San Joaquin Valley the October weather was generally favorable for crops and harvesting, although cool conditions during early part of the month slowed growth of pastures. Strong winds on the 22nd and 23rd interrupted cotton harvesting for two days on the west side of Kings County and reduced the quality of much cotton due to blowing dust.

During the first half of the month the weather in the Santa Maria area had no particularly good or bad effects on crops. Warm days and cold nights during the second half of the month were favorable for chile peppers but unfavorable for lettuce, broccoli, bell peppers, and cauliflower.

Cool nights and warm days in the Los Angeles area during first half of the month were favorable for crops, harvesting activities, and pest control operations. Hot, dry weather during the third week was favorable for the growth, maturing, and harvesting of crops but interrupted pest control operations and increased irrigation water requirements. Grape harvesting was accelerated by the hot weather and was well past the peak. During the last week temperatures were generally cool and favorable for sizing of citrus fruits and clean-up operations. Dry northerly winds scarred some citrus fruits.

In the San Diego area all crops and harvesting activities progressed under nearly normal seasonable weather. Tomatoes will continue to produce abundantly until it rains. Irrigated crops made excellent progress but precipitation is badly needed in all districts.

George H. Barnes

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

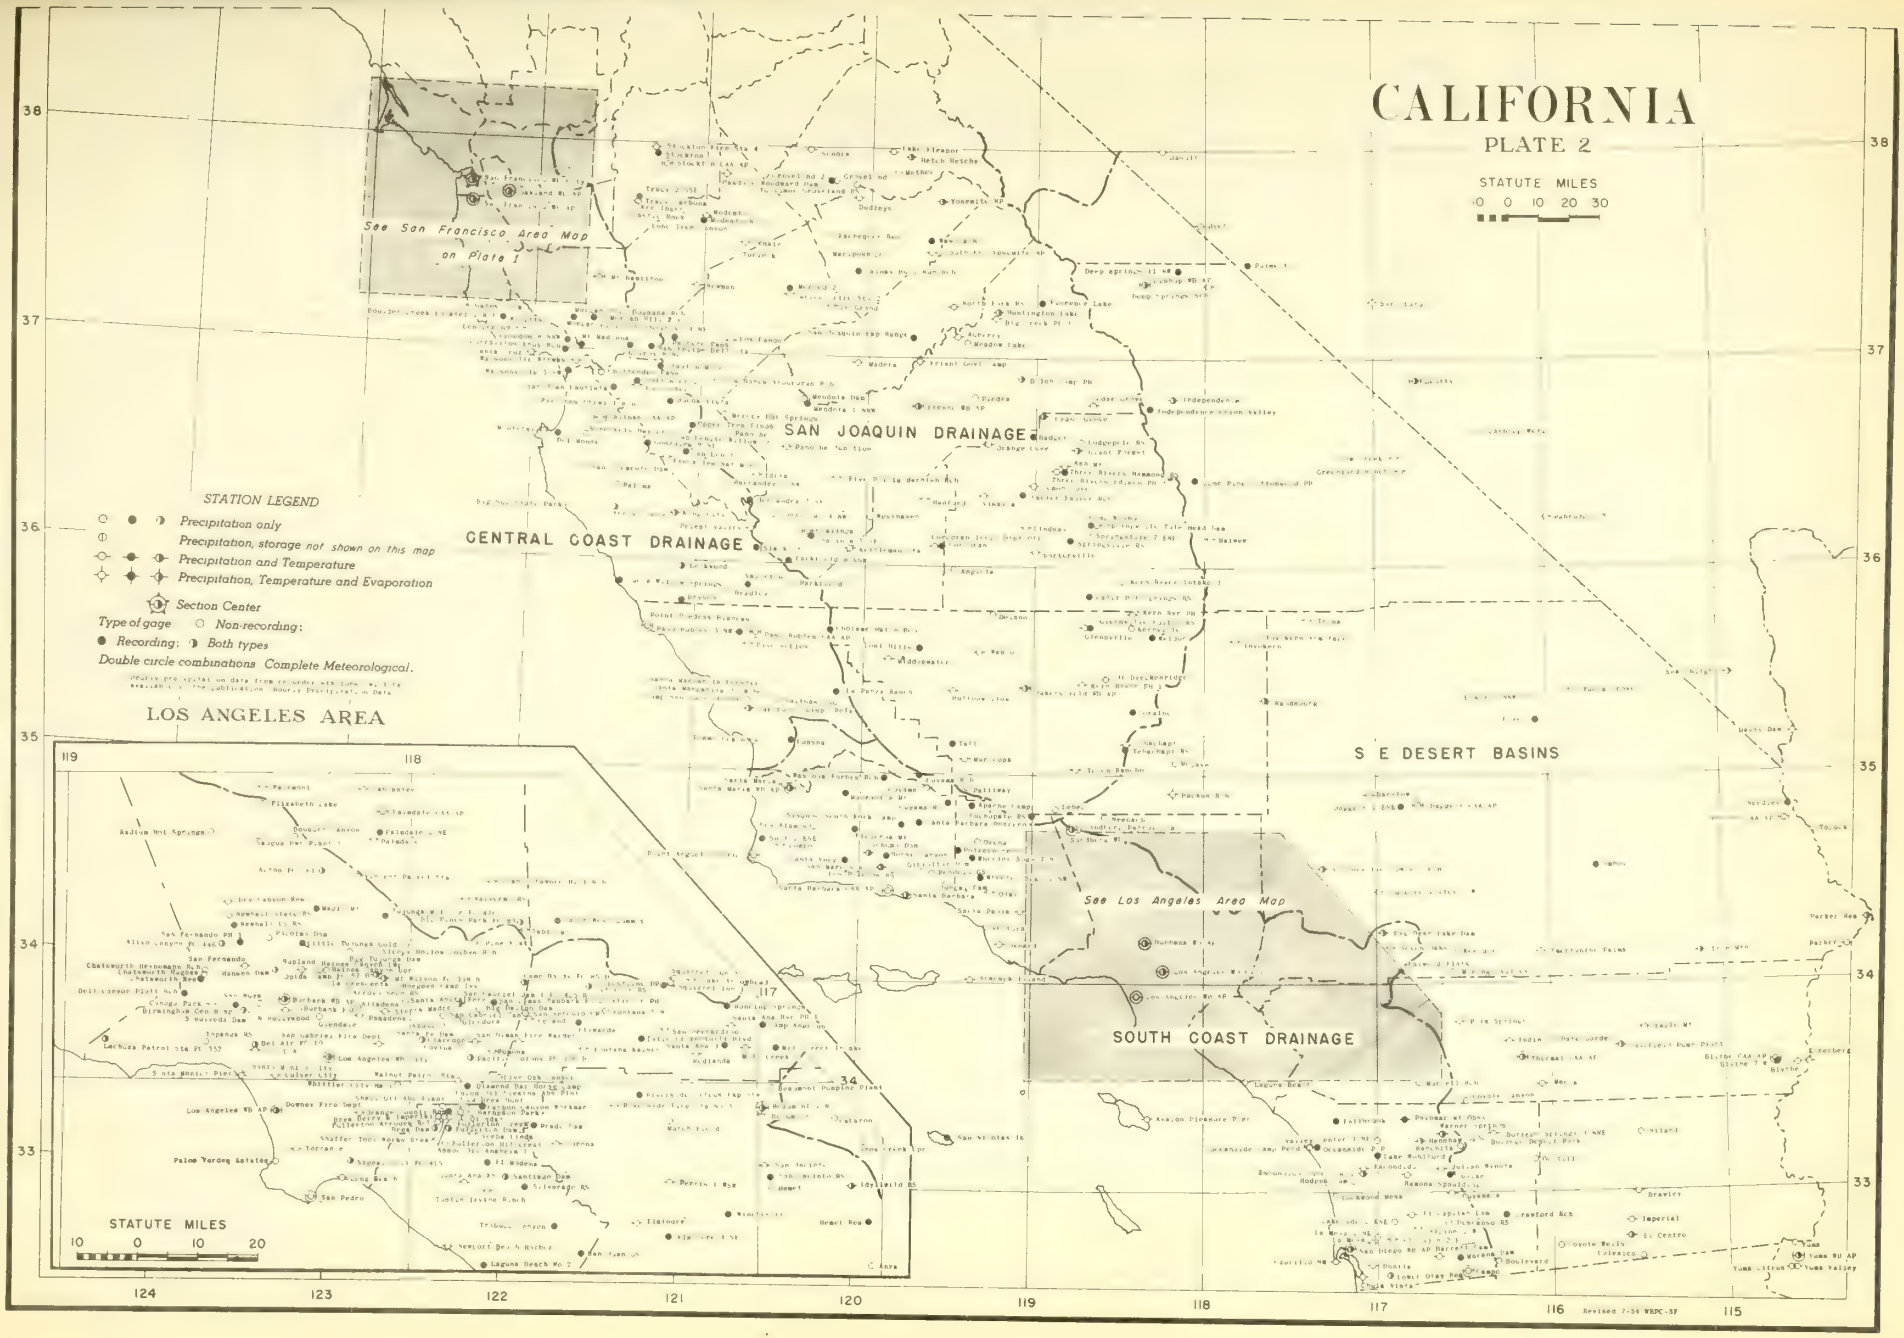
Sleet and hail were included in snowfall averages in Table 1, beginning January 1939.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m. PST except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:30 a.m. PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.



Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations, consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- \- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- \+ And also on a later date or dates.
- * Amounts included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in Station Index means after rain.
- B Adjusted to a full month.
- C In the "Refer to Tables" column in the Station Index the letter 'C' indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
- R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.
- SS This entry in time of observation column in Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.
- VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NOVEMBER 1954
Volume LVIII No. 11

ASHEVILLE: 1955

WEATHER SUMMARY

High pressure systems either along the coast or over the western plateau region dominated the weather picture for November. Storm fronts moving across the State at the end of the first and second weeks were instrumental in bringing average rainfall for the month to slightly above normal and varied amounts of snowfall at higher elevations. Foggy weather was unusually prevalent in the Central Valley, Fresno reporting heavy fog on twelve days against a normal of four days and only 54 percent of possible sunshine which was the least for November since 1944. Weather conditions were generally favorable for agricultural activities, ranges and pastures especially benefiting from the rains. Livestock were in good condition.

The average temperature for the State based on the 314 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 53.5°, 1.5° above the weighted normal. The unweighted average for the same stations was 53.6°, 1.5° above the unweighted normal. The highest temperature for the State was 95° recorded at Mecca on the 22nd and at Elsinore 4 NE on the 25th, both in Riverside County; the lowest was -2° at Twin Lakes in Alpine County on the 30th. Temperatures from the 18th to the 27th averaged well-above normal at most stations in the South Coast Drainage area, the Southeast Desert Basins, the Northeast Interior Basins, and at elevations above 2,000 feet in the Sacramento Drainage. Fresno reported light frost on the 28th and 29th and heavy frost on the 30th, and Red Bluff reported its first killing frost of the season on the 30th.

The average precipitation for the State based on the 324 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 2.72 inches, 0.41 inch above the weighted normal. The unweighted average based on the same stations was 2.86 inches, 0.37 inch above the unweighted normal. The unweighted average based on the 557 stations appearing in Table 3 was 3.06 inches, 0.57 inch above the unweighted normal. The greatest monthly total recorded was 14.33 inches at Cazadero in Sonoma County. No precipitation whatsoever was recorded at five stations and an additional four stations recorded only a trace. At Bakersfield 196 consecutive days without measurable precipitation was ended by 0.04 inch on the 11th, and at Burbank 136 consecutive days without measurable precipitation was ended by 0.35 inch on the 10th. The average precipitation of 5.06 inches in the Sacramento Drainage area was 1.15 inches above normal, while the other six designated divisions averaged only 0.20 inch above normal.

Twin Lakes, at an elevation of 7,829 feet in Alpine County, reported the greatest total monthly snowfall of 30.0 inches, with a maximum accumulation of 19 inches on the ground. Soda Springs, at an elevation of 6,750 feet in Nevada County, reported a total of 13.0 inches, with a maximum accumulation of 9 inches on the ground. The third greatest amount was 5.5 inches at Huntington Lake, at an elevation of 7,020 feet in Fresno County.

Farming activities in the north coastal area was confined mainly to fall plowing. The rainfall was beneficial to ranges and pastures.

In the central coastal area crops and harvesting activities were generally making satisfactory progress by the end of November. However, rains during the middle of the month interrupted harvesting activities and in Lake County planting of most grains will be delayed until spring due to the wet ground. Ranges and pastures were greatly benefited by the rains.

Rains in the second week stopped all harvesting activities for several days in the upper Sacramento Valley but pastures and ranges were greatly improved. The Weather Bureau Office at Mount Shasta reported that fire-weather activities ended on the 8th when 2.78 inches of rain fell in one day. Logging activities were curtailed during the wet period from the 8th through the 15th but resumed soon thereafter.

In the lower Sacramento Valley the warm, dry weather of the first week prolonged the harvest season of tomatoes and rice. However, the rains during the second week brought an end to late tomato harvesting, delayed the final harvesting operations in some rice fields, and delayed the planting of barley and other grain crops. The benefits to pastures and newly seeded crops from the rains outweighed the detrimental effects.

The rains during the second decade in the upper San Joaquin Valley lowered the grades of some cotton but were beneficial to all growing crops and to pastures and ranges. Fog from the 20th to the 26th prevented harvesting of some crops due to the damp conditions. Low temperatures on the last three days of the month resulted in killing the last remaining stalks of sweet corn, but resulted in dropping of leaves from trees and vines thereby facilitating pruning.

In the lower San Joaquin Valley the first week was favorable for all harvesting activities. The rains of the second week stopped cotton picking for several days and lowered the quality of some cotton. Foggy weather later in the month was detrimental to cotton picking and kept the moisture content in grain sorghums unfavorably high. However, in general the rains were sufficient to start growth of grasses on pastures and ranges and aided in the growth of cover crops.

Rains during the middle of the month in the Santa Maria area slowed farming operations for several days and were unfavorable for some late strawberries. Ranges and pastures were improved and most crops were aided by the warm weather following the rains.

In the Los Angeles area the first rainfall of the season on the 10th and continuing light rains through the 15th were very beneficial to orchards, pastures, ranges, and cover crops. There was some damage to peppers and tomatoes. The warm weather which followed the rains was favorable for the growth of citrus and vegetable crops. Harvesting of the Valencia orange crop was completed and harvest of new crop Navel oranges, lemons, and grapefruit was begun.

In the San Diego area the light rains were extremely beneficial to all crops and to pastures and ranges. Clear, warm weather following the rains prevented any serious damage to the tomato crop.

George H. Barnes

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

DECEMBER 1954
Volume LVIII No. 12

ASHEVILLE: 1955

WEATHER SUMMARY

High pressure systems centered over the Great Basin area dominated the weather scene for December. Storm fronts moved inland on the 4th, 7th, 10th, and 13th, and another storm front was beginning to come in from the Gulf of Alaska on the 31st. Rainfall averaged from slightly to considerably above normal from Fresno north, and from slightly to considerably below normal from Fresno south. There was a considerable, though not record-breaking, amount of fog in the Great Central Valley from the 12th to the 26th. Sunshine in the same area ranged from 25 percent to 41 percent of the normal. Earthquakes of some severity occurred on the 16th and 21st, the one on the 21st causing extensive damage in the city of Eureka.

The average temperature for the State, based on the 317 stations listed in Table 2, and weighted with respect to the areas of the various divisions, was 44.1°, or 1.5° below the weighted normal. The unweighted average for the same stations was 44.9°, or 1.2° below the unweighted normal. The highest temperature for the State was 92°, recorded at Fontana, Kaiser Steel Corporation, on the 20th; the lowest was -8°, recorded at Boca on the 26th, and at Soda Springs on the 27th. Temperatures were above normal at most stations from the 1st to the 7th, except above the 2000 foot mark, where they were mostly below normal. In the northern and central coastal areas, and the Sacramento Valley they were mostly below normal from the 7th on, except for a tendency to above normal temperatures at the end of the month. For the balance of the State there was a period marked by temperatures well above normal in most instances from the 14th to the 23rd, with below normal temperatures predominant from thence to the end of the month. Most areas experienced heavy to killing frosts during the last week of the month.

The average precipitation for the State, based on the 321 stations in Table 2, and weighted with respect to the areas of the various divisions, was 3.63 inches, or 0.35 inch below the weighted normal. The unweighted average, based on the same stations, was 3.87 inches, or 0.56 inch below the unweighted normal. The unweighted average, based on the 550 stations appearing in Table 3, was 3.99 inches, or 0.44 inch below the unweighted normal. The greatest monthly total recorded was 20.35 inches at Klamath in Del Norte County. The least recorded was 0.00 inch at seven stations, with an additional eight stations reporting but a trace. The greatest amount reported in any 24 hour observational period was 8.21 inches at Klamath on the 30th. The central coast, southern coast, and southeastern interior areas reported averages below normal, all other areas averaging above normal.

Soda Springs, Nevada County, elevation, 6750 feet, reported the greatest monthly snowfall of 89.0 inches, with a maximum accumulation of 56 inches on the ground on the 10th. Next was Twin Lakes, Alpine County, elevation, 7829 feet, with a total of 70.0 inches, and a maximum accumulation of 50 inches on the ground on the 10th. The third greatest total was at Huntington Lake, Fresno County, elevation, 7020 feet, with a total of 48.5 inches, and a maximum accumulation on the ground of 32 inches on the 10th.

In the north coastal area there was little farming activity due to rains which, however, benefited pastures and ranges.

Cold weather in the central coastal area favor the winter chilling of fruit trees, but retarded t growth of winter truck crops, grains, and pastu and range grasses. Killing frosts during the la few days of the month caused some crop damage Santa Cruz County. Rains were beneficial for ran grasses, but delayed pruning and cultivation, a most other farming activities.

In the upper Sacramento Valley rains hindered t harvest of milo corn, delayed harvesting of stra berry plants, grain planting, plowing, and prunir Some harvest of oil olives in latter portion month. No frost damage was reported. Fall gra is sprouting and doing well.

In the lower Sacramento Valley continued rain fog halted or hindered all harvesting and cultiva ing operations. Rains were favorable for growi crops and range grasses. Forage crops sufficie to keep livestock in good condition. Some limit harvesting of sugar beets. Cold weather unfavorab for rapid growth of pastures, ranges, and grains.

In the lower San Joaquin Valley rains interrupt and finally halted the harvesting of cotton and nav oranges, and hindered the harvesting of grain so ghums, but favored the growth of grains, fora crops, and truck. Low temperatures, however, tend to retard crop growth, and some orchard heating w necessary in citrus groves in the Fresno area duri the last week of the month.

In the upper San Joaquin Valley frosts during t first week nipped remaining tender vegetations, a during the last week damaged unharvested potatoe resulting in losses estimated at 5 percent. Duri the latter period some orchard heating was resort to in citrus groves. Rainfall was generally ligh but foggy weather from the 15th to the 25th help to retain soil moisture, and additional light rai at month's end were beneficial to all growing crop

In the Santa Maria area pastures and all grow crops were doing well because of adequate rain du ing the first half of the month, but the soil w too wet to permit much plowing or planting befo the last week. Livestock were doing well.

In southern California weather conditions up the last week were mostly beneficial to all agricu tural activities. During the last week low tempe tures resulted in some frost damage to avocado celery and other winter vegetables, and to unheat citrus groves, halted all harvest work except f celery, contributed to the defoliation of cotto but favored the heading of lettuce. During the sa period low humidities and strong, desiccating wir resulted in a high fire hazard, and considerable da age to power transmission poles, etc. Along t coast some boats were damaged by high winds and sur Citrus tree and fruit damage was severe at Rivers and other districts, with from 5 to 60 percent the fruit blown from trees. At Fullerton fire loss were estimated at two million dollars, and in t San Bernardino Mountains 3,000 acres of brush a timber were razed by fire. In the Los Angeles ar smog was an important feature of the month's weathe with 24 days of smog, smoke, or dust being reporte Strong winds also caused some damage to alfalfa, a cantaloupe and watermelon vines in the Imperial Va ley.

L. W. Browne

CORRECTED DATA

ANNUAL 1953	PRIEST VALLEY	TABLE 1: Mean temperature for September should be 67.3; November, 47.7 and December 43.5.
APRIL through SEPTEMBER 1954	CACHUMA DAM	TABLES 2 and 5: Delete all min temperatures and monthly mean for the period indicated.
JUNE 1954	ANACAPA ISLAND	DELAYED DATA, April 1954: TABLE 2 and 5, max temperature on 30th should be 58° and min on 30th, 50°. Mean max should be 60.5, mean 56.3 and total degree days 256.
	LAKE CITY	TABLES 2 and 3: Precipitation on 30th should be Trace, monthly total 2.31, departure .90, greatest day .81 on 15th, days with .10 or more 5, .50 or more 1 and 1.00 or more 0.
JULY 1954	NEWARK	TABLE 6: Evaporation on 31st should be .24, monthly total 9.37; wind movement on 31st, 70; monthly total 2192.
	KAISER MEADOWS, LOGAN MEADOWS, OILFIELDS JOAQUIN RIDGE, ROCK CREEK, ROSE MARIE MEADOW AND VERMILLION	PRECIPITATION MEASURED IN STORAGE GAGE TABLE: Delete entire record. See Delayed Data for corrected record.
SEPTEMBER 1954	CANYON DAM	TABLES 2 and 3: Precipitation on 15th should be .44; 17th, .14; monthly total, .58, departure .00, greatest day .44 on 15th and days with .10 or more 2.
OCTOBER 1954	DUDLEYS	TABLES 2 and 5: Min temperature on 31st should be 29°, mean min 32.4, mean 53.7, departure 0.1, lowest 21° on 24th and total degree days 347.
OCTOBER & NOVEMBER 1954	CECILVILLE SAWYER RCH	TABLES 2, 3 and 5: Record should have been published under the name of Cecilville Sawyer Mt. View.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., Blue Canyon WB AP and Sandberg WB 8:00 a.m. PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

\- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CALIFORNIA

ANNUAL SUMMARY 1954

Volume LVIII No. 13

ASHEVILLE: 1955

WEATHER SUMMARY

GENERAL: The average total precipitation for 1954 was near normal in California, a welcome change from the deficient average California precipitation total for 1953. Precipitation totaled slightly above normal for the year in the North Coast and Sacramento Drainage Divisions, near normal in the San Joaquin Drainage Division, and about 85-90 percent of normal in the other four divisions. The U. S. Geological Survey Water Resources Review Annual Summary for the Water Year ending September 30, 1954, showed excessive streamflow in northern California and streamflow generally 75-85 percent of normal in central and southern California. Temperatures averaged slightly above normal for the year with the weather of 1954 generally considered favorable for agriculture.

TEMPERATURES: Although the annual average temperature was only slightly above normal there was considerable monthly variation within the year; February was the warmest on record since 1924, and the 98° recorded at Mecca on the 24th was the highest State February maximum temperature since 1907. The warmest February temperatures were experienced in southern California where temperatures averaged more than 6° above normal. In August unprecedented cool weather occurred in the Central Valley and northern interior portions of the State with the average temperatures at many stations falling below the previous record lowest averages for August. The unweighted August California average temperature of 69.0° was the coldest August on record since 1897. The highest temperature recorded in the State during the year was 125° at Cow Creek in Death Valley on June 22; on this same day the mercury reached 109° at Bishop WB Airport which equalled the absolute record at Bishop recorded in August 1898. The lowest temperature of -11° was recorded in January, February, and March at several stations in the Sierra Nevada Mountains.

PRECIPITATION: Above normal precipitation fell in January in all except the Northeast Interior and Central Coast Drainage Divisions with a mid-month storm bringing heavy rains in the north coastal areas and almost the entire snow pack in the Sierra Nevada Mountains. February precipitation averaged about 75 percent of normal with almost all of the precipitation falling in the period from the 11th through the 18th. March snowfall was much above normal in the Sierra Nevada and southern mountain areas but in April the snowfall was generally light. It was the third driest May in the State since records began in 1897, only about 15 percent of the average State precipitation being recorded. June precipitation was above normal with much above normal snowfall in the Sierra Nevada Mountains. Although July precipitation averaged slightly above normal for the State less than half of the normal precipitation was received in the northern divisions of the State; much above normal precipitation occurred in the southeastern interior and some south coastal districts with some stations reporting the greatest monthly and daily July amounts on record. About twice the State average precipitation was received in August with one of the heaviest and most widespread August storms of record occurring in northern California during the last week. September precipitation was generally deficient in all areas with the driest area in the San Joaquin and Central Coast Drainages; precipitation in the Central Coast averaged only 5 percent of normal, and in the San Joaquin only a trace of rain was received. Less than half of the average precipitation fell in northern California during October and practically no precipitation occurred in the southern half of the State. November precipitation was slightly above normal in all sections and in December precipitation was generally above normal in northern California and below normal in southern California. The driest station in 1954 was Calexico with an annual precipitation total of only 0.40 inch; the wettest was Upper Mattole with an annual total of 99.19 inches.

DESTRUCTIVE STORMS: Heavy rains in the north coastal area on January 15-17 and 26-28 caused significant flooding in streams along the California Coast. The Russian River flooded its banks from Ukiah to Guerneville washing out small bridges, flooding some homes, and reaching its highest stage at Guerneville since February 1940, and at Healdsburg since January 1943. Two major floods were reported on the Eel River at Fernbridge, California. Several periods of moderate to heavy rains in the burned over watershed districts of the San Gabriel Mountains resulted in flash floods and considerable property damage in the foothill cities of Sierra Madre and Monrovia. In mid-February heavy downpours caused flood damage in low-lying sections of the coastal plain from Santa Monica to Long Beach. In March an unusually heavy hailstorm was reported at Courtland on the 19th with some damage to tree buds; on the 16th high winds caused extensive property damage in the Bakersfield area and some damage at George Air Force Base north of Victorville. On June 25 a period of thunderstorm activity in San Bernardino County accompanied by a tornado, high winds, hail, and heavy rain, caused considerable damage to buildings at Bell Mountain. A severe windstorm caused extensive damage in the Palo Verde Valley on July 13, and on the 16th a wind and electrical storm caused considerable structural damage in the Antelope Valley east of Lancaster. One of the most severe thunder and lightning storms of record caused extensive damage to transformers and television sets in Sonoma County on July 24 and 25. On August 31 a severe electrical storm struck during the night in the Imperial Valley and resulted in damage to property and utilities. High winds in southern California the last week of December caused damage to power transmission lines, boats, and horticultural crops.

AGRICULTURE: The critical drought conditions existing the first decade of January 1954 in most sections of the State were greatly alleviated by the rains of mid-January which improved crop conditions, primarily pastures and ranges. Rains during the second decade of February were of considerable benefit to crops and the much above normal temperatures experienced in the last decade greatly accelerated growth of all vegetation. March weather conditions were generally favorable for crops and agricultural field work; however, freezing temperatures occurring in most sections near the middle of the month caused some frost damage to horticultural crops, especially in the lower Sacramento Valley area. The above normal temperatures observed in April and May were generally favorable for the growth of crops and for outside activities. Hazardous forest fire conditions existed in May. June weather was also generally beneficial for agriculture although some damage to crops resulted from killing frosts in the upper Sacramento River Valley on the 4th-6th, and from extremely hot weather in many areas on the 20th-23rd. Crop progress generally continued favorable in July although there was some damage to horticultural crops from high temperatures late in the month in the lower Sacramento Valley and Santa Maria area. The abnormally cool August temperatures delayed ripening of peaches in the Sacramento Valley; heavy rains in northern California near the end of the month were very beneficial for growing crops and ranges but resulted in disastrous losses to the prune crop in Sonoma County. September weather was generally favorable for the development of late growing field crops and for the development and harvest of fruit and nut crops, although below normal temperatures delayed maturing and reduced yields of seed crops. Hazardous forest fire conditions generally existed over the Sierras and in southern California in the period September 23-27. October weather was generally favorable for growing and harvesting crops, however, by the end of the month ranges were very dry and the fire hazard in forested areas was abnormally high. Weather conditions continued favorable in November, ranges and pastures especially benefiting from above normal rainfall. December rains hindered harvest operations but were favorable for growing crops, pastures and ranges. Most areas experienced freezing temperatures during the last week of the month.

Robert F. Dale

REFERENCE NOTES

Unless otherwise indicated dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 4.

The four-digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

- No record.

+ Also later date (dates) or months.

• Amount included in following measurement.

// Gage is equipped with a windshield.

B Adjusted to full month.

C Data for recorder stations denoted by "C" are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".

E Amount is wholly or partially estimated.

M Less than a complete month of record available; if average value is entered, less than 10 days of record are missing. See monthly Climatological Data for detailed daily record.

R Data from recording gage.

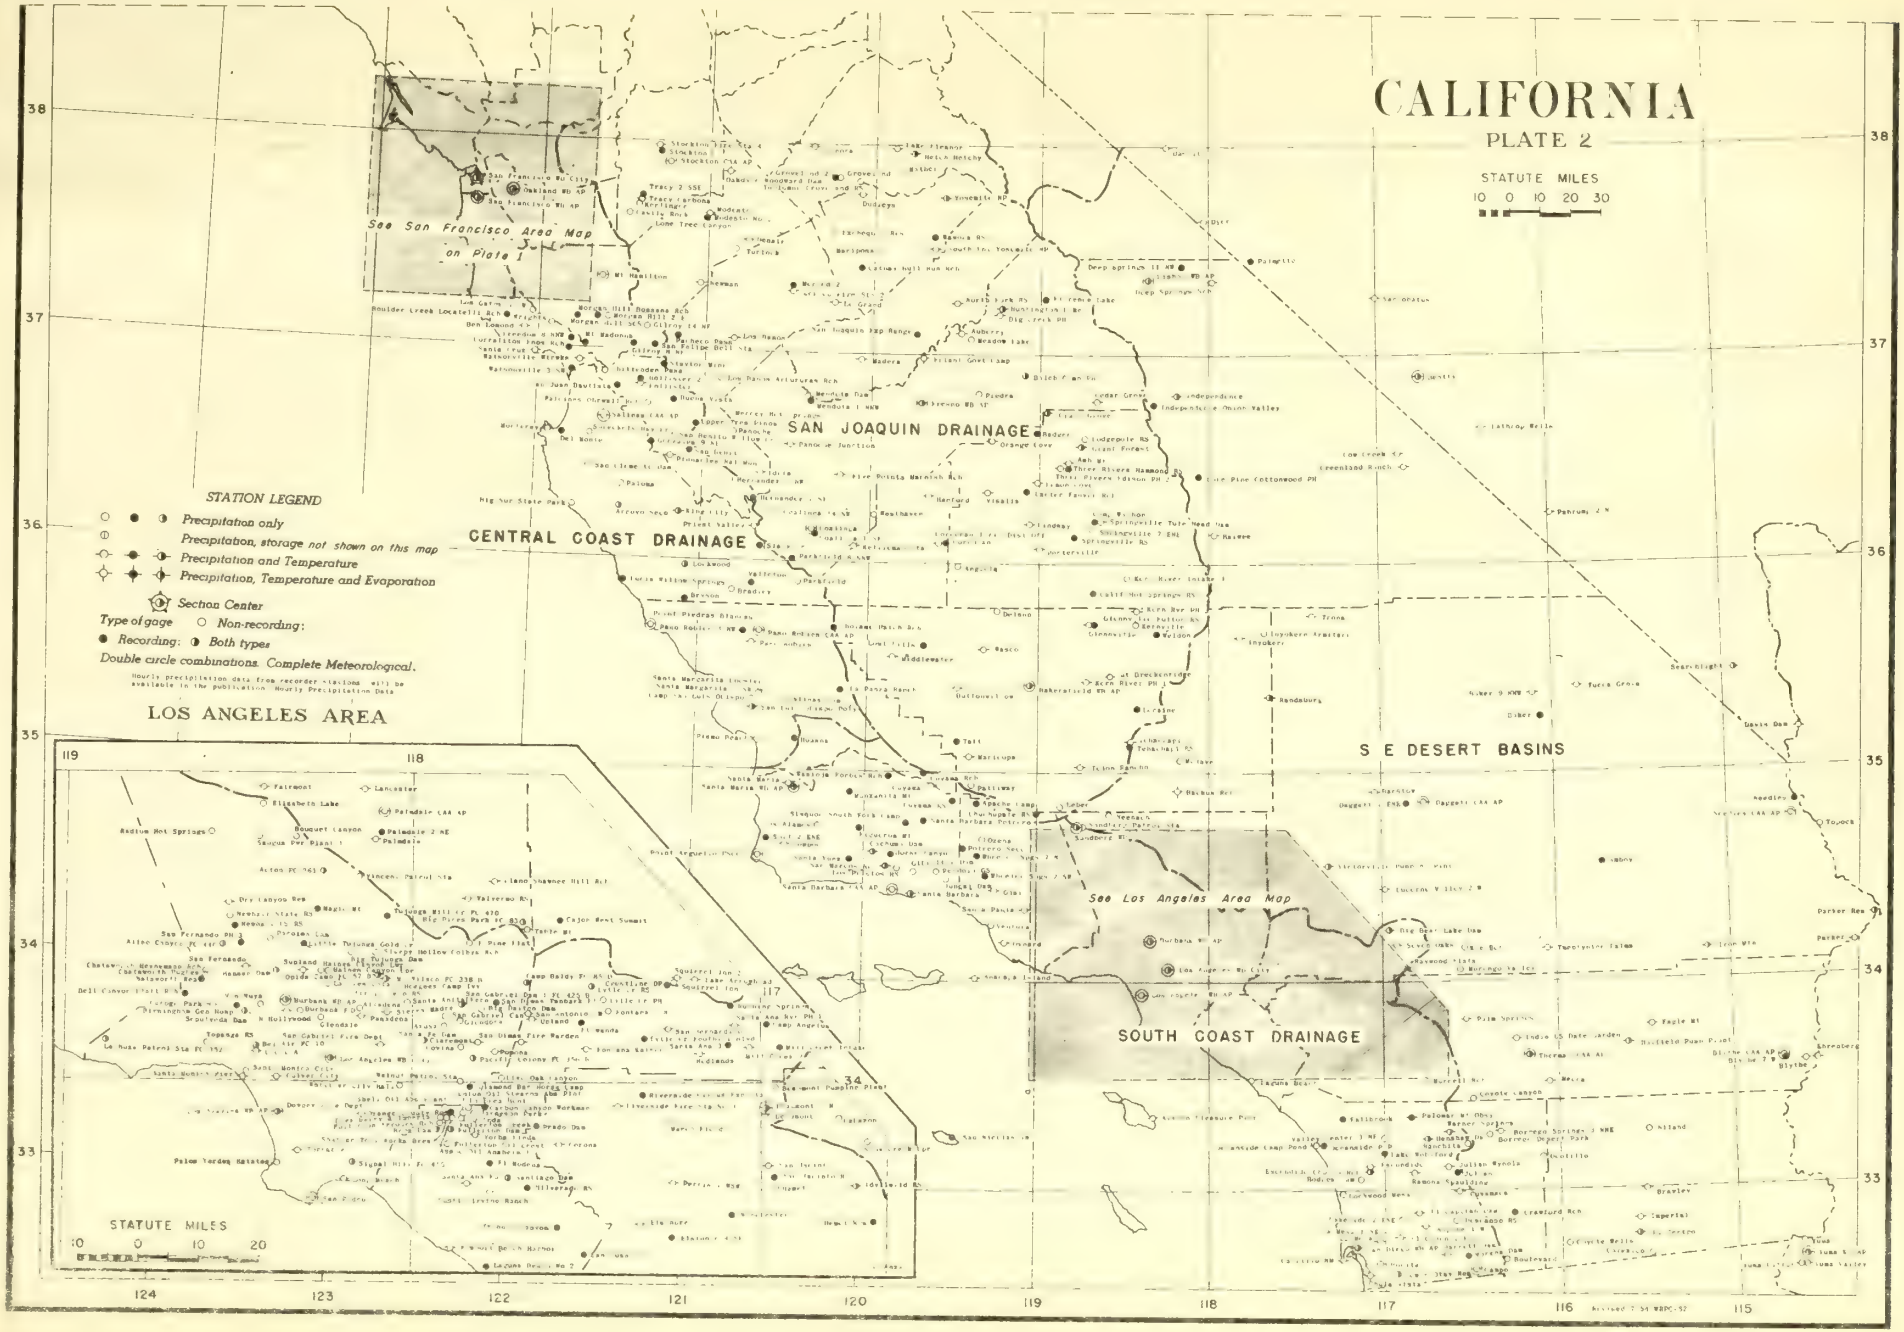
T Trace, an amount too small to measure.

\ Includes total for previous months. V in annual column means total is for a two-year period.

S Storage precipitation station. Data will be published in the July or August or delayed data December issue of Climatological Data.

Additional information regarding the climate of California may obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the annual summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.



ACTON FC 261	All equipment moved 0.7 mile NE. . . .	April	27, 1950
